

HAZARD-LOG HEALTH CHECK

Does your hazard knowledge survive handover?

A hazard log can remain in the project folder while the reasoning behind it quietly disappears. Use these eight prompts before the next assurance gate or phase transition.

1

Traceable source

Can each hazard be traced to a requirement, observation, decision or credible source?

2

Competent ownership

Is one competent person accountable for the hazard and another clearly accountable for each control?

3

Evidence behind the status

Does "closed" point to evidence, or is it simply a word in a status cell?

4

Visible assumptions

Are assumptions, exclusions and rejected options retained beside the decision they shaped?

5

Contradictions found

Can the team spot hazards or controls that duplicate, conflict with or quietly invalidate one another?

6

Versioned decisions

Can a reviewer see what changed, who changed it and why the new position was accepted?

7

Residual risk accepted

Is residual risk accepted by the correct accountable person, with the basis for acceptance recorded?

8

Knowledge travels

Will the reasoning survive the move from design into construction, operation and maintenance?

What your answers might be telling you

Unclear starting point

An AutomateX Bootcamp can help identify the right workflow and first intervention.

Governance or assurance gap

Advisory support can help clarify ownership, controls, evidence and acceptance.

Repeatable deliverable problem

A customised Scribive OS playbook may help make the process consistent and reviewable.

Quick read: six to eight clear answers suggests a healthy handover. Three to five means the process may depend on individual memory. Zero to two deserves a closer look before the next gate.
